

## PRESS RELEASE

### **HCPSL Warrens Hill GPS base station is operational.**

Recently HCPSL has made a significant investment, with the installation of a new GPS base station to its community network. The new base station will operate on frequency 466.1000. Like all HCPSL base stations in its network, it has been surveyed in for transferability between other base stations when operating across the district.

The new installation is part of a strategy to improve GPS base station signal across the Herbert cane growing region.

During HCPSL's recent Strategic Planning process (conducted in late 2021 and early 2022), HCPSL members identified the GPS network as critical to farm operations in the district and requested the company to continue to provide this service to its membership. The HCPSL Board recently approved its 2022-23 budget, with further upgrades and maintenance of the GPS network approved to be undertaken over the next few months.

For more information concerning the HCPSL GPS base station network please contact the HCPSL Manager.
