## Climate Outlook March - April 2022

## SOI TRACKER:

The monthly average SOI for February was positive $7.39(+7.39)$ compared to positive $2.65(+2.65)$ in January. Therefore the SOI phase for February came out as "Rapidly Rising".

|  | SOI VALUE | SOI PHASE |
| :--- | :---: | :---: |
| End of March 2021 | -0.46 | "Rapidly Falling" |
| End of April 2021 | 0.58 | "Consistently Near Zero" |
| End of May 2021 | 3.9 | "Consistently Near Zero" |
| End of June 2021 | 0.04 | "Consistently Near Zero" |
| End of July 2021 | 16.26 | "Rapidly Rising" |
| End of August 2021 | 4.43 | "Consistently Positive" |
| End of September 2021 | 9.19 | "Consistently Positive" |
| End of October 2021 | 7.66 | "Consistently Positive" |
| End of November 2021 | 11.73 | "Consistently Positive" |
| End of December 2021 | 12.99 | "Consistently Positive" |
| End of January 2022 | 2.65 | "Consistently Positive" |
| End of February 2022 | 7.39 | "Rapidly Rising" |

## RAINFALL OUTLOOK

- Median rainfall for March-April at Macknade is equal to 563.3 mm.
- Based on the new SOI phase, we have calculated the chance of exceeding median rainfall for March April for the Herbert region to be $56 \%$. (A $50 \%$ chance is what would be considered the 'normal chance' of experiencing above median rainfall).
- The Upper Quartile (top quartile of rainfall) for March-April at Macknade is equal to 865.8 mm .
- Based on past rainfall events over a period of more than 110 years, the chance of experiencing excessively high rainfall (i.e. rainfall greater than the upper quartile) is equal to $32 \%$. ( $25 \%$ chance is what would be considered the 'normal chance' of experiencing excessively high rainfall.)

## Climate Outlook March - April 2022

## MARCH-APRIL RAIN OUTLOOK FOR INGHAM IN DETAIL:

Since 1892 when rainfall records commenced at Macknade, there have been 25 occasions when the SOI phase at the end of February was "Rapidly Rising". These years were:

| 1910 | 1914 | 1924 | 1925 | 1928 | 1933 | 1944 | 1946 | 1949 | 1950 | 1955 | 1961 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1965 | 1968 | 1971 | 1975 | 1977 | 1979 | 1984 | 1985 | 1997 | 2000 | 2002 | 2004 |

During those 25 years, total rainfall for March-April exceeded the median 14 times. Therefore the chance of exceeding median rainfall for March-April is $14 / 25=56 \%$.

A high amount of rainfall (i.e. rain greater than 865.8 mm ) resulted 8 times. So the chance of high rainfall is equal to $8 / 25=32 \%$.

There have been 25 years when the SOI phase at the end of February was in a Rapidly Rising phase (coloured Bars)
In 14 of those years the rainfall during Mar-Apr exceeded the median.
The chance that the Rainfall during Mar-Apr will exceed the median $=14 / 25=56 \%$ In 8 of those years the Rainfall during Mar-Apr exceeded the Upper Quartile.
The chance that the Rainfall during Mar-Apr will exceed the Upper Quartile $=8 / 25=32 \%$

Comparison to Last Year

| Mar - Apr 2022 |  | Mar - Apr 2021 |
| :--- | :---: | :---: |
| SOI Phase | Rapidly Rising | Consistently Positive |
| Chance of above median rainfall | $56 \%$ | $59 \%$ |
| Chance of excessively high rainfall | $32 \%$ | $31 \%$ |
